

CSCE 242 Project

Website Name: Carolina Cross Country and Track and Field Club Website

The Carolina Cross Country and Track and Field Club is a sports club at the University of South Carolina. For this project, I will create a website for the cross country and track and field club (Club XC&TF). It will include information on how new members can join, club records for all the race and field events, information on social and racing past events, and the schedule for the upcoming season. The website will need to allow admin to update information so there needs to be a way for admin to login. Data stored on the website will include a table with club records. On each page of the website, there will be pictures from past seasons where appropriate.

Pages:

Home: The home page will contain a description of the club (this is a club sports team at USC and our goal is ...), price of dues, and how to join with links for the various forms needed including a link to the Instagram page. There will also be a slideshow of pictures from past seasons.

Schedule: current schedule in calendar format for the semester including races and social events. There will also be a table containing the upcoming week's practice routes.

Past events: photos and description of club events both social and racing, Links to race results from the previous season

Club Records: Records for all cross country and track and field events for men and women. Club records will include the record time, name of record holder, year broken, and race in which the record was broken.

About Us: When the club was founded, club mission statement, introduction to each of the officers

Contact Us: The user can input their contact info and ask questions. The questions will be sent to XC&TF club email account. Additionally, on this page, there will be an FAQ section. Each of the FAQs will have a drop-down which will have the answers to the question.

Data Storage: Data stored on this website will include a table of the club records which will be on the "Club Records" page. Only admin will be able to add or update the records, so there will need to be accounts with login. Other data stored will be the event details and weekly schedule on the "Schedule" page.
